

WESTERN EXCELSIOR WEBSITE UPDATED

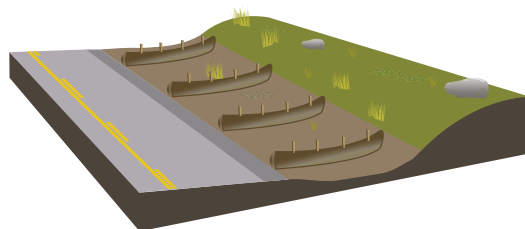

EXCEL EROSION EDUCATION CIRCULAR - V4 NOW AVAILABLE

Release Date: 2/24/09

Western Excelsior is dedicated to providing educational resources for the erosion control professional. Excel Erosion Education Circular (E³C) is developed and distributed by Western Excelsior and provides information pertinent and specific to the erosion control industry. Volume 4 has been dedicated to providing an introduction to sediment control practices and sediment control logs. E³C (all volumes) are available for download/viewing at www.westernexcelsior.com or may be distributed in print by Western Excelsior sales contacts.

Sediment control products are used to minimize the transport of soil from the project site. Placed to provide a perimeter guard or control points within a channel network, sediment control logs provide filtration and energy dissipation. Sediment control logs are provided in a variety of diameters and lengths and can be modified in the field to conform to project site requirements. Western Excelsior produces sediment logs with straw fiber matrices and 100% high altitude rocky mountain excelsior.

As the need for performance based solutions for pollution control grows, sediment control technology plays an increasing role in the minimization of sediment transport. The flexibility and utility of sediment control logs provide a unique and economical solution. Produced at both the Mancos, Colorado and Macon, Georgia manufacturing facility, Western Excelsior sediment control logs are readily available. Visit www.westernexcelsior.com for specific information regarding Western Excelsior products. Additionally, E³C

Volume 4 provides greater detail regarding sediment control logs and illustrates the value and utility of the products.
