

WESTERN EXCELSIOR WEB SITE UPDATED INTRODUCING TACKMAT_x

Release Date: 5/7/10

Western Excelsior has developed the next, evolutionary step in Rolled Erosion Control Products (RECPs). Tackmat_x is an Extended Term Erosion Control Blanket consisting of high altitude rocky mountain excelsior, secured (stitched) to a single net (top). Netting options include regular, rapid go and all natural. The extraordinary feature of Tackmat_x that sets it apart from any other ECB is the inclusion of a broad spectrum, high performance polyacrylamide. This innovation improves the erosion control performance of the material to a point where nearly every grain of soil is protected and secured from rainfall and runoff. In addition to virtually eliminating erosion, the stable soil surface is ideal for vegetation establishment. Coupled with the mulching performance of the excelsior matrix, Tackmat_x provides impressive vegetation establishment, even in harsh environments.

In full scale performance testing, Tackmat_x yielded no measurable soil loss. In fact, the runoff from the plot was completely clear (pictured above). The structural stability afforded by the netting, combined with the excelsior matrix and polyacrylamide ensures the project site is protected from foot traffic, rainfall, runoff and will be vegetated in short order. Tackmat_x is available in natural color or dyed green for an instantly aesthetic appearance. Finally, the polyacrylamide utilized in Tackmat_x is approved by the Environmental Protection Agency (EPA) as Generally Regarded as Safe (GRAS).

Tackmat_x is versatile, high performance, long lasting and available nation wide. Compared to other ECBs, Tackmat_x simply provides greater performance, minimizes risk and faster vegetation establishment. Read all about Tackmat_x here at westernexcelsior.com on the dedicated product page.
