

WESTERN EXCELSIOR WEB SITE UPDATED INTRODUCING TACKMAT_s

Release Date: 6/24/10

Western Excelsior has developed the next, evolutionary step in Rolled Erosion Control Products (RECPs). Tackmat_s is a Temporary Erosion Control Blanket consisting of 100% certified weed free straw matrix, secured (stitched) to a single net (top). Netting options include regular, rapid go and all natural. The extraordinary feature of Tackmat_s that sets it apart from any other ECB is the inclusion of a high performance, all natural tackifier. This innovation improves the erosion control performance of the material to a point where nearly every grain of soil is protected and secured from rainfall and runoff. In addition to virtually eliminating erosion, the stable soil surface is ideal for vegetation establishment. Coupled with the mulching performance of the straw matrix, Tackmat_s provides improved vegetation establishment, even in harsh environments.

In full scale performance testing, Tackmat_s yielded almost no measurable soil loss. In fact, the runoff from the plot was completely clear (pictured above). The structural stability afforded by the netting, combined with the straw matrix and tackifier ensures the project site is protected from foot traffic, rainfall, runoff and will be vegetated in short order.

Tackmat_s is an excellent tool for the erosion control professional, providing upgraded performance for daily erosion control projects. By minimizing risk and maximizing vegetation establishment, more projects are completed on time and on budget. To ensure your next project requires no repairs, choose Tackmat_s. Read all about Tackmat_s here at westernexcelsior.com on the dedicated product page.
